

## **1    ABSTRACT OF THE DISCLOSURE**

2            A cutter assembly has an adapter, a cutter body, a central drill and two  
3    positioning screws. The cutter body is detachably attached to the adapter. A first  
4    facet is defined in the outer periphery of the post. A cylindrical saw is formed on  
5    and extends from the bottom of the base. The central drill is detachably mounted  
6    on the adapter and extends through the cutter body. A second facet is defined in  
7    the outer periphery of the central drill. The positioning screws are screwed into  
8    the adapter and respectively abut against the facets on the cutter body and the  
9    central drill. With such an arrangement, the cutter body can be easily detached  
10   from the adapter when the cutter body is damaged or worn.
